

# Existence of Normal Paths

by Sven Nilsen, 2019

*In this paper I introduce a non-ambiguous notation for existence of normal paths.*

Existence of a normal path<sup>[1]</sup> is expressed in path semantics by putting  $\exists?$  in front of a normal path:

$$\exists?f[g_{i \rightarrow n}] : \text{bool}$$

It is equivalent to asking whether the path set<sup>[2]</sup> is non-empty:

$$\exists?f[g_{i \rightarrow n}] \quad \Leftrightarrow \quad f[g_{i \rightarrow n}] \neq \{\}$$

It can also be expressed in first-order logic<sup>[3]</sup>:

$$\exists?f[g_{i \rightarrow n}] \Leftrightarrow \exists h \{ \forall x : \forall f \{ f(g_0(x_0), g_1(x_1), \dots, g_{n-1}(x_{n-1})) = g_n(h(x_0, x_1, \dots, x_{n-1})) \} \}$$

Here,  $\forall f$  means the trivial path (domain) of  $f$ <sup>[4]</sup>.

A common way to write is a function that can be substituted with another:

$$f[g_{i \rightarrow n}] \Leftrightarrow h$$

The substitution is valid if and only if the following equation has a solution  $h$ :

$$\forall x : \forall f \{ f(g_0(x_0), g_1(x_1), \dots, g_{n-1}(x_{n-1})) = g_n(h(x_0, x_1, \dots, x_{n-1})) \}$$

For multiple solutions, one can write (where  $h$  is a function):

$$f[g_{i \rightarrow n}] \Rightarrow h$$

Multiple solutions can also be expressed as the path set<sup>[2]</sup> containing at least two functions:

$$f[g_{i \rightarrow n}] \Leftrightarrow \{h_0, h_1, \dots\}$$

The notation  $\exists?$  is used to not mix notation with the existential path:

$\exists f$       Existential path (a function that tells what  $f$  returns, codomain)

$\exists?f$       Existence of function (‘true’ if the function  $f$  exists, ‘false’ otherwise)

It makes only sense to ask whether a function exists in a language that can talk about the function indirectly.

The expression  $f[g_{i \rightarrow n}]$  points to a function “out there” that predicts property  $g_n$  from properties  $g_i$  of  $f$ .
