

# Emph Notation

by Sven Nilsen, 2020

*In this paper I derive notation for subsets of an abstract path, called “emphs”.*

Assume the following two pairs that are unique universal binary relations:

$$(a, b) \quad (b, c)$$

$$\text{role\_of}(b) = p$$

$$\text{role\_of}(c) = q$$

Using function composition:

$$q(p(a)) = (q \cdot p)(a) = c$$

This composition can not be turned into a unique universal binary relation, because  $`c`$  is already assigned the role  $`q`$  and can not have  $`q \cdot p`$  as an additional role. Neither does it make sense when  $`p`$  and  $`q`$  are different roles:

$$(a, c) \quad \text{is not valid because it would imply the role of `b` and `c` are the same}$$

However, using the semantics of an Avatar Graph, one can construct an “avatar” of  $`c`$ . This avatar behaves like  $`c`$  except that it is assigned the role  $`q \cdot p`$ :

$$(a, c_{q \cdot p})$$

Since  $`q`$  is already known from  $`c`$ , one can simplify this notation further:

$$(a, c_p)$$

Ideally, one would like to avoid mentioning  $`p`$ , since it makes abstract generalizations harder. Instead of  $`p`$ , one could use:

$$(a, c_{ab})$$

However,  $`a`$  is already known from the pair, so this can be reduced to:

$$(a, c_b)$$

Now, instead of using subscript  $`c_b`$ , it is easier to compose using an arrow notation:

$$(a, b \rightarrow c)$$

Likewise, it is possible to construct an “avatar”  $`a \rightarrow b`$  of  $`b`$ , such that  $`(a \rightarrow b, c)`$ .

These two descriptions emphasize different aspects of the same underlying abstract path using avatars.

There are two different choices of how to interpret the emphasis in a readable way:

1.  $\text{`}(a, b \rightarrow c)\text{'}$  emphasizes  $\text{`}b \rightarrow c\text{'}$
2.  $\text{`}(a, b \rightarrow c)\text{'}$  emphasizes  $\text{`}(a, b)\text{'}$

The first version only refers to the avatar  $\text{`}b \rightarrow c\text{'}$  of  $\text{`}c\text{'}$ .

The second version refers to a subset of the path  $\text{`}(a, b)\text{'}$ .

I choose the second version, because it refers to a subset of the path.

In general, this notation can be used with n-tuples, where  $\text{`,`}$  and  $\text{`}\rightarrow\text{'}$  are separators:

$(a \rightarrow b \rightarrow c, d)$	emphasizes $\text{`}(c, d)\text{'}$
$(a, b \rightarrow c, d)$	emphasizes $\text{`}(a, b)\text{'}$ and $\text{`}(c, d)\text{'}$
$(a, b, c, d)$	emphasizes the entire path
$(a \rightarrow b \rightarrow c \rightarrow d)$	emphasizes no part of the path

Because of the emphasis of a subset of the path, it is called “Emph Notation”.

For example, in standard path semantics one can write a subtype:

$\text{false} : [\text{not}] \text{true}$

This is path where the emphasis is:

$(\text{not}(\text{false}), \text{true} \rightarrow \text{bool})$  emphasizes  $\text{`}(\text{not}(\text{false}), \text{true})\text{'}$

The role of  $\text{`true}\text{'}$  is  $\text{`value\_of}\text{'}$ , so the full unique universal binary relation is:

$\text{value\_of}(\text{not}(\text{false}), \text{true})$

That  $\text{`true}\text{'}$  has the type  $\text{`bool}\text{'}$  is not important, although it proves that the subtype makes sense.

If the type of  $\text{`true}\text{'}$  was emphasized, then one would “leave” the input to the function  $\text{`not}\text{'}$ :

$(\text{not}(\text{false}) \rightarrow \text{true}, \text{bool})$	emphasizes $\text{`}(\text{true}, \text{bool})\text{'}$
$\text{type\_of}(\text{true}, \text{bool})$	full emphasized unique universal binary relation

Emph notation is used to signify which part of a path that is important to focus on.

It describes a subset of the path, which contains at least one relation when the subset is non-empty.

While  $\text{`}(a, b \rightarrow c)\text{'}$  emphasizes  $\text{`}(a, b)\text{'}$ , it also describes a relation  $\text{`}(a, c_b)\text{'}$  which is the abstract path from  $\text{`}a\text{'}$  to  $\text{`}c\text{'}$ . With other words, an “emph” describes both a proof and a part of the proof that is considered more important than the rest of the proof.
