Avatar Logic to Set Theory

by Sven Nilsen, 2021

In this paper I introduce a method of translating Avatar Logic to Zermelo-Fraenkel Set Theory.

The axioms of Avatar Logic^[1] might be translated to Zermelo-Fraenkel Set Theory^[2]:

```
(a, b) \land b : p \land uniq(b)
(p, (a, b)) \land ∃! z { (p, (a, z)) } \land ∃! r { (r, (a, b)) }
(a, q'(b)) \land q'(b) : p
(p, (a, (q, b))) \land ∀ x { ∃! z { (p, (a, (z, x))) } } \land ∃! r { (r, (a, (q, b))) }
```

Instead of predicates e.g. `p(a, b)`, a pair used instead `(p, (a, b))` to avoid Second-Order Logic [3].

Translation must happen for every relation, otherwise it would require extending Second-Order Logic^[3] with tuples, roles and 1-avatars. Per relation requires only First-Order Logic^[4].

The translation uses Kuratowski's definiton^[5] of an ordered pair $\{x\}, \{x, y\}\}$ for x'(y). This representation is chosen because ordered pairs are not used as arguments in Avatar Logic.

Ordered pairs might also be used without `b:p`, but only to mean `(a, b)` as a binary relation.

The `uniq` predicate returns `true` for all atomic symbols, plus those 1-avatars that are optionally chosen to be behaving uniquely. Both axioms must be applied when the 1-avatar is unique.

An expanded version is provided on the next page.
