Binary Square Matrix Combinatorics

by Sven Nilsen, 2020

In this paper I formalize binary square matrix combinatorics using Directional Set Algebra.

For all `n : nat`, there is an associated binary square matrix combinatorics:

0	Empty matrix set
D	Diagonal matrix set
U	Upper triangle matrix set
L	Lower triangle matrix set
1	All matrices

The following law holds with Directional Set Algebra:

$$D + U + L = 1$$

Sizes of sets:

$$|0| = 0$$
$$|D| = 2^n$$
$$|1| = 2^{(n \cdot n)}$$
$$|U| = |L| = 2^{(n \cdot (n - 1) / 2)}$$

Sub-types of binary matrix sets can be constructed using elements `0`, `1` and `?`.
The following laws holds with Directional Set Algebra, where `?` is top and there is no bottom:

$$0 + 1 = ?$$

For example, for `n = 3`:

```
? 0 0        0 ? ?        0 0 0        ? ? ?
0 ? 0   +    0 0 ?   +    ? 0 0    =   ? ? ?
0 0 ?        0 0 0        ? ? 0        ? ? ?
```
